PDPlot

Pressure vs Depth Analysis

1 Introduction

PDPIot is an easy to use application developed for Petroleum Reservoir Pressure versus Depth Plotting and Analysis.

Though the use of **PDPlot** you will ultimately :

- Achieve better quality pressure versus depth analyses,
- Save a significant amount of time and shift the emphasis from *preparation and presentation time* to *interpretation time*,
- Deliver presentation quality plots and graphics quickly.

License.dat File

The "License.dat" file is located in the Application Startup folder (eg C:\Program Files\Petroleum Solutions\PDPlot\)

The contents of this ASCII license file needs to contain the following license information.

[License Settings] LicensedTO = Company = ProductID = LicenseID =

9

If any of the above License key information is incorrect or absent, or if the License.dat file is missing then the application will fail to startup.

.NET Framework

This application requires the presence or installation of Microsoft .Net Framework version 2.

.NET Framework version 2 is a component of the Microsoft Windows® operating system used to build and run Windows-based applications.

Should .NET Framework version 2 not be installed on the destination PC then a link is provided below to download this system software. The user should download and install .NET Framework version 2 before attempting to install this application.

Inttp://www.petroleumsolutions.co.uk/downloads.html

The installation of .Net Framework also requires a minimum software and hardware requirement. Details of which are shown below. Specifically, note that you cannot install the .NET Framework on a computer running the Microsoft Windows 95 operating system.

Minimum requirements

To install .NET Framework [Dotnetfx2.exe], you must have one of the following operating systems, with Microsoft Internet Explorer 5.01 or later installed on your computer:

- Microsoft® Windows® 98
- Microsoft® Windows® 98 Second Edition
- Microsoft® Windows® Millennium Edition (Windows Me)
- Microsoft® Windows NT® 4 (Workstation or Server) with Service Pack 6a
- Microsoft® Windows® 2000 (Professional, Server, or Advanced Server) with the latest Windows service pack and critical updates available from the Microsoft Security Web site (www.microsoft. com/security).
- Microsoft® Windows® XP (Home or Professional)

Recommended hardware

	CPU Recommended	RAM Recommended
Client	Pentium 90 MHz or faster	96 MB or higher

PDPlot

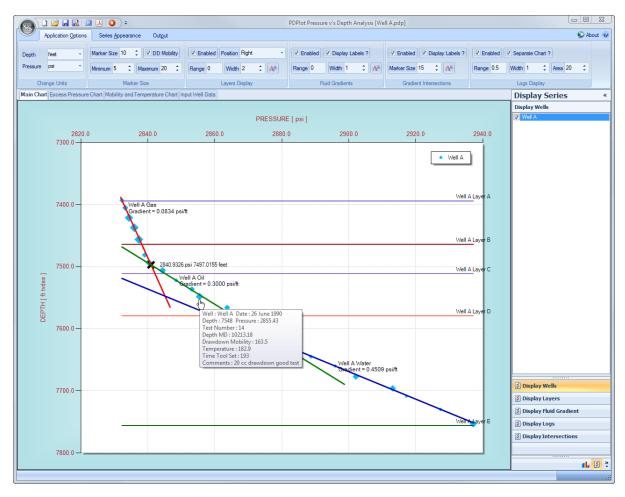

Pressure vs Depth Analysis

2 Getting Started

The main application display is shown below.

All of the following help sections will lead you through how to get the most out of PDPlot, and hopefully demonstrate how you can save time, and achieve better pressure versus depth analyses, through the use of this very easy to use application.

2.1 Add Well

Before any well specific data can be input into PDPlot, the user must first add a well by pressing the "Add Well" button, located in the "Input Well Data" TAB.

To "Add Well" simply press the button as shown is the picture below.

	■ 👃 🔕 =		PDPlot Pressure v's Depth Analy
Application Options	Series <u>Appearance</u> Out <u>p</u> ut		
Depth feet • Pressure psi •	Marker Size 10 Minimum 5 Maximum 20 Maximum 20	Enabled Position Right Range 0 Width 2 A ^a	Image Image
Change Units	Marker Size	Layers Display	Fluid Gradients
Main Chart Excess Pressur	e Chart Mobility and Temperature Chart Ir	nput Well Data	
Add Well	Delete Well		
Select Well	•	Survey Date / /	

An input box will pop-up requesting a text name or description for the new well, followed by a further input box requesting the date that the pressure vs depth survey was taken.

Please use different names for well name or description, otherwise a warning message will be generated and the user will be asked to re-enter a unique well name.

Once the user has successfully input a well name, the remainder of the "Input Well Data" sub panels will become visible, allowing the user to input pressure, depth, layer, PVT, and display log data.

	💕 🔒 🔣 🛛	= 📕 🔕) =					PDPI	ot Pressure v's D	epth Analy

- Either manually input depth and pressure data [typing and TABBING from cell to cell],
- Copy [CTRL+C] data from an external application and paste [CTRL+V] blocks of any data into the Pressure Data input table,
- Drag and drop data from an external application, that supports drag and drop operations, such as Microsoft Excel,
- or, choose to import a table of pre-formatted data via the "Import CSV File" button located at the bottom of the "Pressure Data" sub panel. CSV files are comma delimited text files that can be edited via Microsoft packages such as Notepad or Excel.

Two different formats are accepted as CSV input :

- 1. Two Columns of data; Depth, Pressure
- 2. Ten Columns of data, in the following order ;
 - *Test Number,* is the pressure depth survey test number.
 - **Depth MD**, is the measured depth value of the pressure survey
 - Depth tvdss, is the true vertical depth value of the pressure survey
 - Pressure, is the actual measured pressure value
 - Hydrostatic Pressure Before Test,
 - Hydrostatic Pressure After Test,
 - **Drawdown Mobility,** is the calculated Drawdown Mobility from the individual pressure survey, Drawdown mobility represents the permeability of the formation divided by the viscosity of the

mobile fluid.

- *Temperature,* is the bottom hole temperature on station.
- *Tool Time Set,* is the time, in seconds, that the tool was on station determining the final stabilized pressure.
- **Comments**, can be any text string (although commas are not permitted, as commas are used to delimit strings in the ASCII file saving process) to describe or annotate that specific datapoint.

The Test Number, Depth MD, Hydrostatic Pressure Before Test, Hydrostatic Pressure After Test, Drawdown Mobility, Temperature, Tool Time Set and Comments are used to construct Mouse Chart Tips, in the main chart, in order to allow to user to better analyse good pressure points from suspect pressure points.

Examples of both of the above input CSV formats are shown below :

Once the user has successfully input depth and pressure data, this data will be shown on the Main Chart.

2.3 Input Fluid Gradient Data

Fluid Gradient Data can be entered into the Main Display Chart via two different methods. The First Method explicitly calculates fluid density with the knowledge of other fluid properties. The Second Method is simple linear regression through selected chart data points.

Fluid gradients and PVT input have been deliberately left entirely in Oilfield imperial units; ie. "psi/ft", since it is very common industry practice to quote fluid density values in this manner. For example gas gradient of 0.08 psi/ft, oil gradient of 0.3 psi/ft and water gradient of 0.45 psi/ft.

To explicitly calculate fluid density, the user must first press the "Add Fluid Gradient" button, as shown below.

) 💕 🛃 🐼		1 🛃 🙆	=										PDPI	ot Pre	ssure v's	Depth	Analy
	Application Opti	ons	Series <u>/</u>	ppeara	nce O	ut <u>p</u> ut												
Depth	feet	•	Marker Size	10	¢ 🔽 D	D Mobilit	y	C Enabled	Position	Right		Ŧ		Enabled	•	Display La	abels ?]
Pressure	psi	- [Minimum 5	\$	Maximum	20	÷	Range 0	Width	2	\$	Aa	Ra	inge O	V	Vidth 1	¢	Aa
Cha	nge Units			Mark	ter Size				Layers D	Display					Fluid	Gradients		
Main Chart	Excess Press	sure C	Chart Mobi	ity and	Temperatu	ire Char	t Inj	put Well Data										
	Add Well			Delet	e Well													
Sel	ect Well	Well A	A			•	:	Survey Date	26/0	06/1990)	•						
Pressure	Data Layer Da	ita Fl	luid Gradie	nt Data	Log Data													
Ad	d Fluid Gradie	nt 🖓	De	lete Flu	iid Gradien	t												
									Input Flu	id Prop	erty a	nd Den:	sity Da	ata				

A confirmation box will pop-up in order to confirm that the fluid gradient will be associated with the currently selected well. To confirm press the "Yes" button, otherwise select the "No" button then select the Well required to add a fluid gradient to via the Well Name drop-down box, located under the Main "Add Well" and "Delete Well" buttons, then repeat the process.

A further input box will pop-up asking the user to input a name or description for the Fluid Gradient. This input box will automatically have the well name populated in the input box, but the user can delete/ modify/add any text they wish to best describe the Fluid Gradient.

Once the user has successfully input a description the remainder of the Fluid Gradient Data sub-panel will become visible.

		Input Fluid Property and Density Data
Select Fluid Density	Well A Gas	Gas Oil Water Hydrostatic
Depth [ft tvd]		Calculate Gas Gravity and Expansion Factor from Composition
Pressure [psi]		Gas Gravity
	Fluid Type	
	Gas	Gas Expansion Factor, E scf/rcf
	© Oil	or, Gas Formation Volume Factor, Bg rb/scf, or
		rcf/scf
	() Water	Gas Pressure Gradient, psi/ft
	 Hydrostatic 	
		Gradient Coefficients, y = m.x + C
		Gradient, m Intercept, C Depth = Infinity x Pressure + 0
		Depth = Infinity x Pressure + 0
		Calculate / Store Values

The user can then toggle between the Fluid Type radio buttons, which will automatically toggle the Fluid Type sub-panels to match the Fluid Type selection.

A Depth and Pressure data point must be entered into this Input PVT data Panel, since it determines where to anchor the pressure gradient.

The user can either choose to :

- Calculate the relevant fluid pressure gradient with a knowledge of the other PVT parameters
- Simply type in a value in the relevant Pressure Gradient input textbox

The above applies in all the Gas, Oil and Water input sections.

The pressure range that the pressure gradient is displayed is automatically chosen as the complete range of the individual well pressure vs depth points. To modify this display gradient simply choose the "Stretch/Shrink PVT Gradients" menu item on the Main Chart Context Menu [accessed by right mouse click on the Main Chart Display]. See Stretch/Shrink PVT Gradients for more information.

2.3.1 Gas Example

For example, assuming the fluid gradient in the above example is gas, but the user does not know the gas gravity or expansion factor or gas pressure gradient, but does know the gas composition and reservoir temperature. Select the "Calculate Gas Gravity and Expansion Factor from Composition" and another input form will pop-up requesting the composition and reservoir temperature. See below.

ut Gas Compostion			Input Pressure and Temperature					
		Composition (Mole Percent)		Pressure	2833.258	psi 🔻		
Methane	C1	72	Te	mperature	175	deg. F 💌		
Ethane	C2	15	Calcula	tione				
Propane	C3	7	Calcula	uona				
Butane	C4	4		Pseudo F	Reduced P	4.275086		
Iso Butane	iC4	2	[Pseudo Reduced T		1.507038 0.783350		
Pentane	C5							
Iso Pentane	iC5		1					
Hexane	C6			Expansion F	actor, scf/rcf	201.484922		
Heptanes +	C7+			Gas	Gravity	0.781274		
Nitrogen	N2					Calculate N		
Carbon Dioxide	CO2							
Hydrogen Sulphide	H2S							
Total Mole	Percent	100						
Re	mainder	0			OH	Cance		

Once the input composition and reservoir temperature are input [Pressure was copied from the main input panel previously, assuming a value was entered], the user should press the "Calculate" button. This will calculate the relevant Z factor, Expansion Factor and Gas Gravity. Once this calculation has been performed the user can press the "OK" button to return these values to the Main application or the "Cancel" button to return to the main application without the calculated values.

Once these values are returned by the user pressing the "OK" button, the application calculates the Gas pressure gradient with a knowledge of Gas gravity and Expansion factor.

A simpler approach to the above can be achieved if the user knows the Gas gravity and Expansion factor. If this is the case then simply TAB down or mouse select the Gas Gravity input textbox and type in the value, then TAB across or mouse select the Gas Expansion Factor input textbox.

Gas Oil Water Hydrostatic		
Calculate Gas Gravity and Expansion Factor	from Composition	
Gas Gravity	0.781274]
Gas Expansion Factor, E	201	scf/rcf
or, Gas Formation Volume Factor, Bg	7	rb/scf, or
		rcf/scf
Gas Pressure Gradient, psi/ft]

Once these two values have been input the user can press the "Calculate/Store" button, and the Gas

Pressure gradient will be calculated and displayed in the Main display chart.

Assuming any two of the three variables are input the "Calculate/Store" button calculates for the unknown variable.

2.3.2 Oil Example

The oil pressure gradient is calculated in a similar fashion. An example is provided below :

		Input Fluid Property and Density Data	
Select Fluid Density	Well A Gas	Gas Oil Water Hydrostatic	
Depth [ft tvd]	7405	Oil API Gravity	30.00
Pressure [psi]	2833.258	or, Oil SG	0.876160
	Fluid Type	or, Oil Density at Standard Conditions (Ibs/ft³)	54.6987
	() Gas	Gas Gravity	0.7800
	 Oil 	or, Gas Density at Standard Conditions (Ibs/ft³)	0.059514
	() Water	Solution GOR, Rs (scf/stb)	341
	() Hydrostatic	Oil FVF. Bo (rb/stb)	1.35
		Oil Density at Reservoir Conditions (Ibs/ft³)	
		or, Oil Pressure Gradient (psi/ft)	
		Gradient Coefficients, y = m.x +	<u> </u>
		Gradient, m Depth = x Pressure +	Intercept, C
			Calculate / Store Values

Assuming the user knows Oil API gravity, gas gravity, Solution GOR and Oil Formation Volume Factor and their values are typed into the relevant input textboxes, the user can press the "Calculate/Store" button and the Oil Pressure gradient will be calculated and displayed in the Main display chart.

Back-calculation also works here with the "Calculate/Store" button, ie. Assuming any four of the five variables are input into the relevant input textboxes, the "Calculate/Store" button will calculate the unknown variable.

2.3.3 Water Example

Again, the water pressure gradient is calculated in a similar fashion to Gas and Oil examples.

An example is provided below :

		Input Fluid Property and Density Data	
Select Fluid Density	Well A Gas	Gas Oil Water Hydrostatic	
Depth [ft tvd] Pressure [psi]	7405 2833.258	Temperature, deg F Salinity, ppm	178 95000
	Fluid Type Gas Oil Water Hydrostatic	Water Density at Reservoir Conditions (Ibs/ft ²) or, Water Pressure Gradient (psi/ft)	64.9259 0.450874
		Gradient Coefficients, y = m.x + Gradient, m Depth = x Pressure +	Intercept, C

Assuming the user knows Reservoir Temperature and Aquifer Water Salinity and their values are typed into the relevant input textboxes, the user can press the "Calculate/Store" button and the Water Pressure gradient will be calculated and displayed in the Main display chart.

Water salinity should be in the range of 0 to 300,000 ppm [fully saturated]. If the input value of salinity exceeds 300,000ppm a warning message will be displayed.

Back-calculation does not apply in this section.

2.4 Input Layer Data

The intention with Layer Data is to display layer depth values on the Main Display Chart alongside the Depth vs Pressure data. Layer depth data is associated with a specific Well, but the Layer Name is intended to be common to all Wells within a project.

To add a Layer Name simply press the "Add Layer" button located on the "Layer Data" sub panel, as shown below.

) 📂 🔒 🛛	. 🖸	. 🖌 🛛) =							PDPIc	ot Pressure v's	Depth Analy:
	Application Op	tions	Series A	ppeara	nce Ou	itput							
Depth	feet	•	Marker Size) Mobility	Enabled			•	Enabled		
Pressure	psi	_	Minimum 5	÷	Maximum	20 🛟	Range 0	Width	2	Aa	Range 0	Width 1	‡ <mark>A</mark> a
Cha	nge Units			Mark	er Size			Layers D	splay			Fluid Gradients	
Main Chart	Excess Pres	ssure	Chart Mobil	ity and	Temperatu	re Chart II	nput Well Data						
	Add Well			Delet	e Well								
Se	ect Well	Well	A		[•	Survey Date	26/0	6/1990	•]		
Pressure	Data Layer I	Data F	luid Gradie	nt Data	Log Data								
	Add Layer	G		Laj	yer Name		Depth [ft tvdss]		1				
	Delete Layer												

Once the user presses the "Add Layer" button, an input box will pop-up requesting a name or description for the layer name. Once the user has successfully input a Layer name, the name is added to list of layers on the Layer Data sub-panel, as shown below.

Add Well	Delete Well			
Select Well A	•	Survey Date	26/06/1990	•
Pressure Data Layer Data Fluid C	Gradient Data Log Data			
Add Layer	Layer Name 🛛 🖌	Depth [ft tvdss]		
	Layer A			
Delete Layer		ß		

The user can then input data in a number of different ways :

- Either manually manually type depth values into the input text box adjacent to the Layer Name,
- Copy [CTRL+C] data from an external application and paste [CTRL+V] blocks of data into the Layer Data input table,
- Drag and drop data from an external application, that supports drag and drop operations, such as Microsoft Excel,
- or, if there are multiple layer names then the user can import a single column CSV file with associated depth values. The order of the depth values within the CSV file should correspond to the order of the Layer Names in the Layer Data sub-panel. Examples are shown below.

2.5 Input Log Data

Log data is treated in a similar fashion to Layer Data.

The intention is simply to display a log alongside the pressure vs depth data. The log type and values can represent any log, but the intent is to allow the user to better interpret layer pressure breaks to better aid individual layer correlation, as well as water saturation type logs for better determination of transition zones, oil water contacts and free water levels. Therefore recommendations for input logs would be gamma ray, vshale, resistivity, calculated Sw, etc.

Once individual logs have been successfully input they can be toggled on/off the Main display chart by toggling the selection in the Display Logs Toggle box.

To input a Log, the user must first add a Log, by pressing the "Add Log" button, as shown below.

	■ 📕 🔕 🗧			PDPlot Pressure v's De	pth Anal
Application Options	Series Appearance Output				
Depth feet •	Marker Size 10 🛟 🔽 DD Mobility	Enabled Position R		Enabled Display Labe	
Pressure psi *	Minimum 5 2 Maximum 20 2	Range 0 Width 2	‡ Aa	Range 0 Width 1	‡ Aa

Add Well	Delete Well				
Select Well Well	A	Survey Date 26/06	/1990 🔽		
Pressure Data Layer Data F	luid Gradient Data				
Add Log	Delete Log				
Select Log	· · · ·	Depth [ft tvdss]	Je Â		

A confirmation box will pop-up in order to confirm that the fluid gradient will be associated with the currently selected well. To confirm press the "Yes" button, otherwise select the "No" button then select the Well required to add a log to via the Well Name drop-down box, located under the Main "Add Well" and "Delete Well" buttons, then repeat the process.

A further input box will pop-up asking the user to input a name or description for the well Log. This input box will automatically have the well name populated in the input box, but the user can delete/modify/add any text they wish to best describe the well Log.

Once the user has successfully input a description the remainder of the input Log data sub- panel will become visible, as shown below.

Add Well Delete Well Select Well Well A Pressure Data Layer Data Fluid Gradient Data Log Data	Survey Date 26/06/1990
Add Log Delete Log Select Log Wel AGR	Depth [ft tvdss] Log Value
Log Depths and Layer Depths	[ft tvdss]
Max Log Depth Min Layer Depth Max Layer Depth	
	Import CSV File

Again, the user can input data in a number of different ways :

- Either manually input depth and pressure data [typing and TABBING from cell to cell],
- Copy [CTRL+C] data from an external application and paste [CTRL+V] blocks of any data into the Log Data input table,
- Drag and drop data from an external application, that supports drag and drop operations, such as Microsoft Excel,
- or, perhaps best input via the Import CSV File button, as shown above. This will import a two column width CSV or ASCII txt file, examples are included below.

		А	В	С	C
Well A GR.csv - Notepad	1	7390	150		
File Edit Format View Help	2	7390.5	142.5		
7200 150	3	7391	122.5

7398.5,54.3					
7399,57.5					
7399.5,60					
7400 52 5					

Once the user presses the "Import CSV File" button and selects an appropriate file, a pop-up dialog box will ask the user if they want to clip the input log data to the minimum and maximum layer depth values associated with the selected well. Select the "Yes" button to clip the Import CSV data, otherwise select the "No" button to have the entire log displayed.

The resultant input Log display should look like the example below :

Select Well A	Survey Date	26/06/1990					
sure Data Layer Data Fluid Gradient Data Log Data							
Add Log Delete Log]						
Select Log Well A GR	Depth [ft tvdss]	Log Value	50.0	70.0	90.0	110.0	130.0 150

	7407.5	65.025					
		Import CSV File					

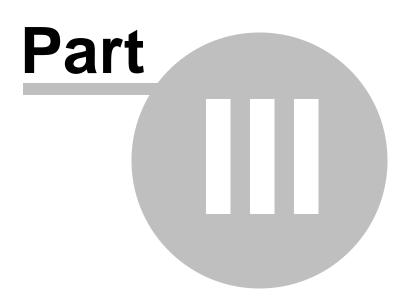

In the Main Display Chart, the Log Values are scaled between the Minimum and Maximum Pressure values of the selected well, via a scaling parameter that can be varied by selecting the Main Menu item "Options", then "Chart Display", then "Logs X Range Tolerance". The user can input a value from 0 to 1 to scale between the Minimum and Maximum Pressure values.

The user can also zoom in/out in the log display, and by a right mouse click in the Log Display Chart select the "Move layer Values" menu item. Once this menu item is checked, the user can left mouse click and drag the layer to the desired depth. Once this process is complete un-check the "Move layer Values" menu item to toggle off the modification of Layer Values.

PDPlot

Pressure vs Depth Analysis

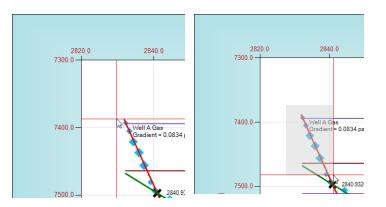

3 Main Chart Operations

3.1 Zooming / Unzooming

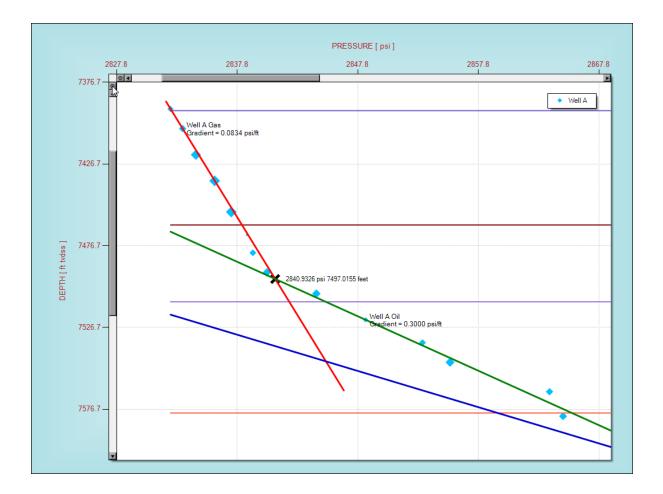

Zooming and unzooming within the main chart area couldn't be easier !

Simply single click the left mouse button and hold down and drag a highlighted rectangle. See the following pictures below that demonstrate zooming into a specific area.

To unzoom simply single (left mouse button) click in the top left hand corner Reset Button, as highlighted with the Cursor in the picture below.

The user can also scroll horizontally and vertically using the scroll bar arrows and bars located within the horizontal and vertical scrollbar tracks.

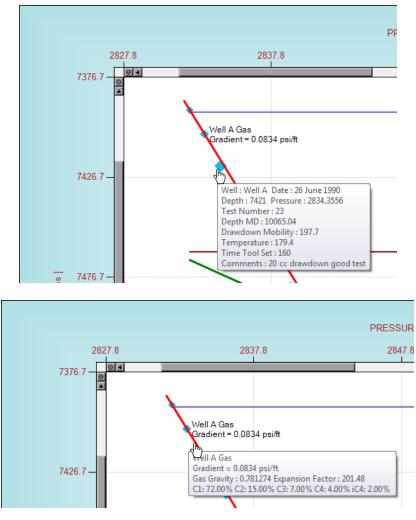

3.2 Chart Tooltips

Chart tooltips are created automatically and their content depends on the amount of data the user enters. The more data entered, the more data is added as tooltips to aid the user interpret and display representative fluid pressure gradients.

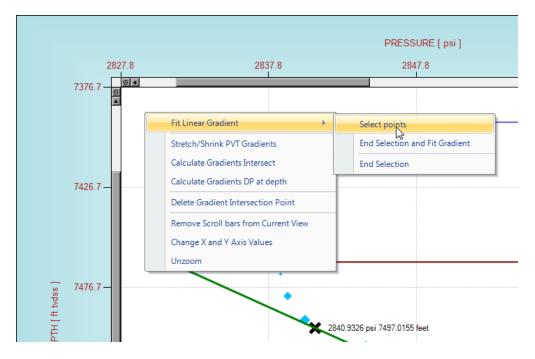

To display tooltips simply hold the cursor over a datapoint, fluid gradient, layer or log display.

Examples are provided below of tooltips.

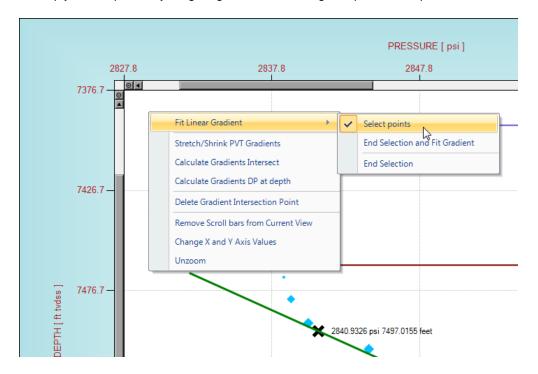

3.3 Fit Linear Gradient

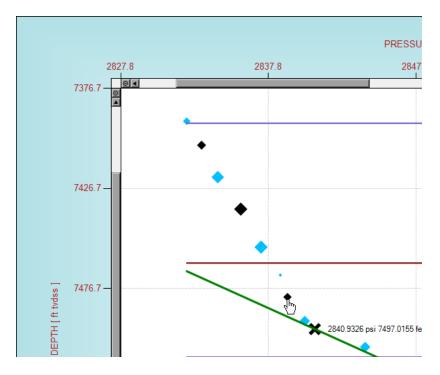

As well as entering fluid gradient data via the <u>Input Fluid Gradient Data</u>, which calculates fluid density with the knowledge of other fluid properties, the user can simply add a fluid pressure gradient via the Fit Linear Gradient menu, accessed by a single right click on the main chart area, see below.

To select individual points to be regressed select the **Select Points** menu option, to toggle on, to the right of the **Fit Linear Gradient** menu item.

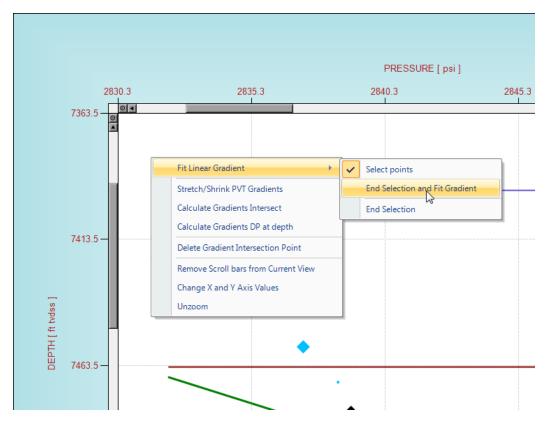

Once this **Select Points** menu option is toggled on [check mark against **Select Points** menu option], see below, simply select points by single right mouse clicking on specific datapoints.

To remove specific datapoints from selection simply re-click the same point. As points are added to the selection their color turns to black to highlighted they are selected and the pressure gradient, absolute deviation and number of selected points are shown in the status bars panels at the base of the application. Absolute deviation is the mean absolute deviation (in terms of y) of the points from the fitted line.

Once the user is happy with the number and selection of data points for linear regression, they can either select the *End Selection* menu item to clear the selection and NOT add a linear fluid gradient, or select the *End Selection and Fit Gradient* menu item to add a linear fluid gradient through the selected points. See picture below.

Assuming the user clicked the *End Selection and Fit Gradient* menu item, the user will be prompted to enter a PVT gradient description to identify the specific fluid gradient. The input textbox will automatically contain the wellname that the selected datapoints were associated to. The user can change/modify any text to best describe that specific fluid gradient, but please attempt to use a unique description, since identical descriptions can cause confusion for the application.

Once the description has been input correctly, the user will be prompted with another input dialog box to identify the type of fluid. The application will attempt to identify the fluid type depending on the fluid gradient value, but the user can change this fluid type by selecting the appropriate radio button. See pictures below.

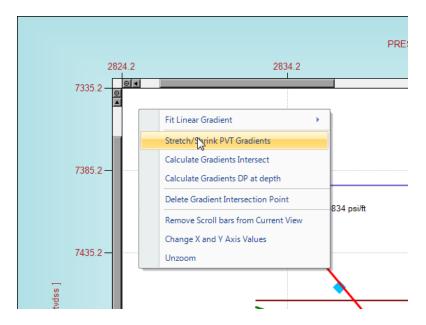

Add PVT Gradient Description
Please input PVT Gradient Description
Well A Gas

S Gradient Regression Fluid Type	
Please Select Gradient Regression Fluid Type	
© Oil	
© Water	
ок	

Once the user has successfully completed the above, a fluid gradient is added to the main chart display and the *Display Fluid Gradient* checked listbox, located at the right hand side edge of the application.

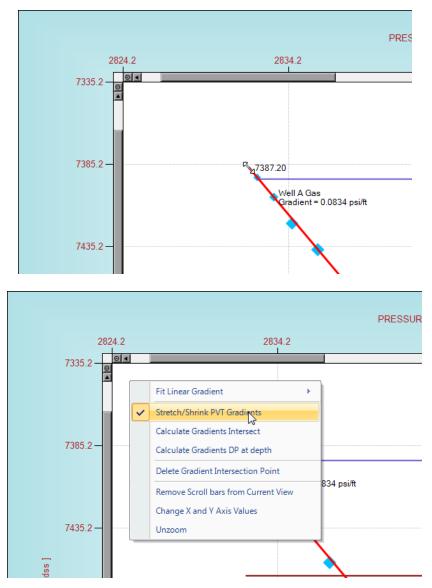

3.4 Stretch/Shrink PVT Gradients

The user can stretch or shrink the fluid gradient by selecting [to toggle on] the *Stretch/Shrink PVT Gradients* menu option is [check mark against *Stretch/Shrink PVT Gradients* menu option], accessed by a single right click on the main chart area. See below.

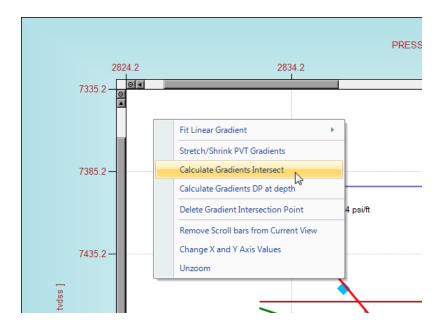

Once the Stretch/Shrink PVT Gradients menu option is toggled on, the user can left-hand mouse click and drag the extremes of the fluid gradient. The cursor will change to a NW-SE arrows to indicate the user can drag the fluid gradient to the required location.

Once the user is happy with the position of all the fluid gradients, select the Stretch/Shrink PVT Gradients menu option again to toggle off this option. The check mark should disappear against Stretch/Shrink PVT Gradients menu option.

3.5 Calculate Gradients Intersect

Assuming the user has input 2 non-parallel fluid gradients, the user can select the Calculate Gradients Intersect menu item, accessed by a single right click on the main chart area. See below.

The user will be prompted with an input box that permits the selection of the 2 non-parallel fluid gradients. Once the user selects these 2 fluid gradients, then presses OK button a messagebox will appear with the calculated intersected pressure and depth point. A further input box will pop-up asking the user if they would like the calculated intersection point added to the main chart. See pictures below.

💿 Calculate Intersection of Two Fluid Gradients	x

Add Intersection Point to Cha	rt?
Would you like to add calcu	ulated intesection point to Chart ?
	Yes No

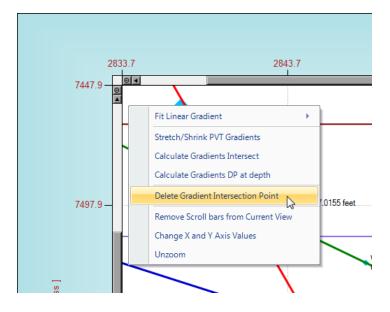

Assuming the user pressed the **Yes** button in the above **Add Intersection Point to Chart ?** pop-up input box, the intersection point will be added to the chart as shown below.

Should the user wish to not display the intersection point or intersection point label or change the label font, then the user can toggle on/off the these displays by enabling or disabling the *Gradient Intersections* options contained within the *Application Options* Ribbon tab, as shown below.

Should the user wish to delete an intersection point, the user can select the *Delete Gradient Intersection Point* menu item, accessed by a single right click on the main chart area. See below.

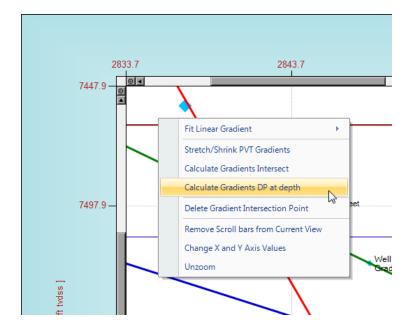

The user will then be prompted with an input box, requesting the user to select which gradient intersection point to delete.

Delete Gradient Intersection Point	X
Select Gradient Intersection Series to Delete	
Well A Gas and Well A Oil	▼
	OK Cancel

3.6 Calculate Gradients DP at depth

This routine is similar to the previous calculation of intersection points, however the intention is to provide a simple way of calculating the pressure difference between any 2 parallel or non- parallel fluid gradients for a given depth value.

To calculate the pressure difference between any 2 fluid gradients, the user can select the *Calculate Gradients DP at depth* menu item, accessed by a single right click on the main chart area. See below.

The user will then be prompted to select 2 fluid gradients and then input the required depth value to calculate the pressure difference. See below.

Calculate Pre	essure Difference between Two Fluid Gradients at Depth	x
Well A	Select Two Fluid Gradients Fluid Gradient 1 Gas	
	OK Cancel	
	Input Depth to Calculate Pressure Difference	
	Please input a Depth value in 0

Once 2 fluid gradients have been chosen and a depth value input, a message box will pop-up with the calculated pressure difference.

Pressure Difference between Two Fluid Gradients Gradients	3
Pressure Difference between Fluid Gradients : Well A Gas, and Well A Oil, is 26.6377 psi at 7620 feet	
<mark>⊳o</mark> ĸ	

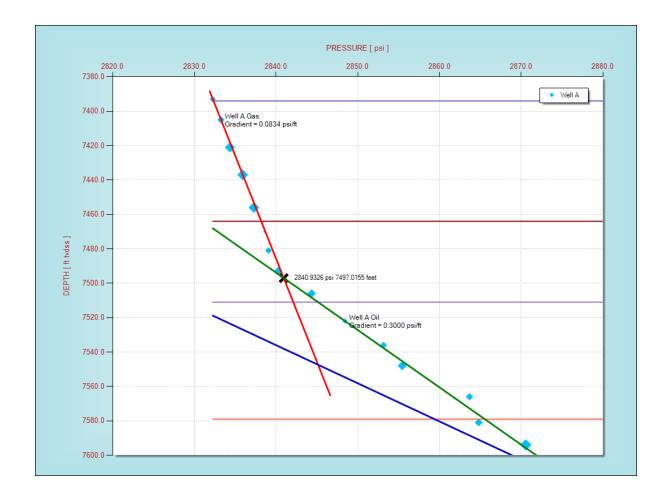

3.7 Change X and Y Axis Values

The *Change X and Y Axis Values* menu toggle item, accessed by a single right click on the main chart area, is provided primarily for presentation and report output but also provided as a global reset view option.

Once the user selects the *Change X and Y Axis Values* menu toggle item an input box will popup with the current X and Y minimum and maximum values. To change these values to more aesthetic or rounded numbers simply type in new values and press the OK button. See pictures below.

The result should like the following:

PDPlot

Pressure v/s Depth Analysis

4 Excess Pressure Chart Operations

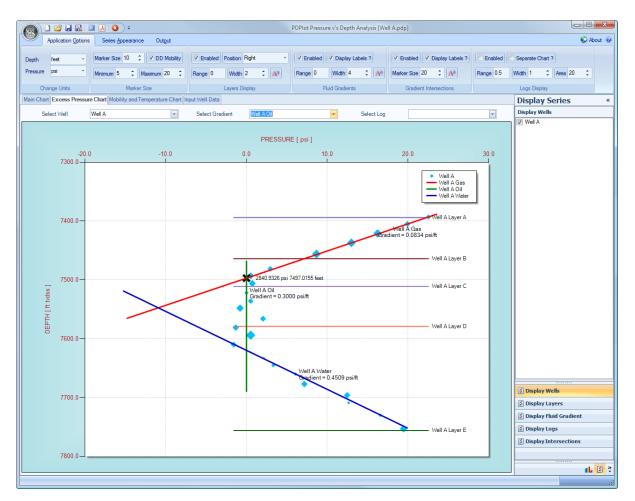

The Excess pressure chart is an alternative pressure vs depth display. This display normalises the pressure data for a specific Fluid gradient. This technique essentially removes the effects of the selected fluid density, and therefore improves the visualisation of small density differences and pressure barriers that may not be as apparent on standard pressure vs depth plots.

For more details on the use of Excess Pressure Plots please refer to "Improved Interpretation of Wireline Pressure Data", by Alton Brown, AAPG Bulletin v87 No2, February 2003.

The Excess Pressure chart becomes active when at least one well pressure vs depth data has been entered, together with at least one Fluid gradient. To display the Excess Pressure chart select a well and gradient via the dropdown listboxes located at the base of the Excess Pressure chart area, as shown below.

) 💕 🔒		= 🔇 🔊					PDPlot Pressu	re v's Depth	Analysis [Wel	ll A.pdp]					. O X

S	elect Well	l	Well A		Select Grad	dient			•	Select Log			•	Display We	lls	

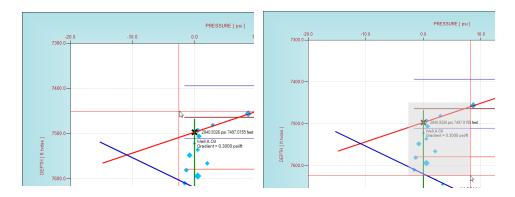

In the example shown below, the selected Fluid Gradient is the "Well A Oil" gradient. All other pressure data and existing gradient data are normalised to this selected gradient. The selected gradient appears as a vertical line. Any pressure data or other gradient data that deviates from this gradient can either relate to density differences, pressure barriers or non- representative datapoints (eg. supercharged). In the example below, it becomes very apparent that both the pressure data and gradient data deviate as a result of the gas and water fluid density differences.

4.1 Zooming / Unzooming

As with the Main chart, Zooming and unzooming within the Excess Pressure chart area couldn't be easier !

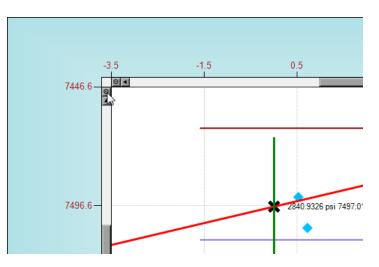

Simply single click the left mouse button and hold down and drag a highlighted rectangle. See the following pictures below that demonstrate zooming into a specific area.

To unzoom simply single (left mouse button) click in the top left hand corner Reset Button, as

highlighted with the Cursor in the picture below.

The user can also scroll horizontally and vertically using the scroll bar arrows and bars located within the horizontal and vertical scrollbar tracks.

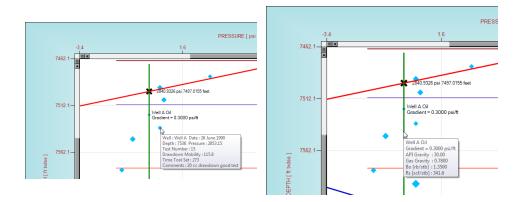

4.2 Chart Tooltips

As with the Main chart, Chart tooltips are created automatically and their content depends on the amount of data the user enters. The more data entered, the more data is added as tooltips to aid the user interpret and display representative fluid pressure gradients.

To display tooltips simply hold the cursor over a datapoint, fluid gradient, layer or log display.

Examples are provided below of tooltips.

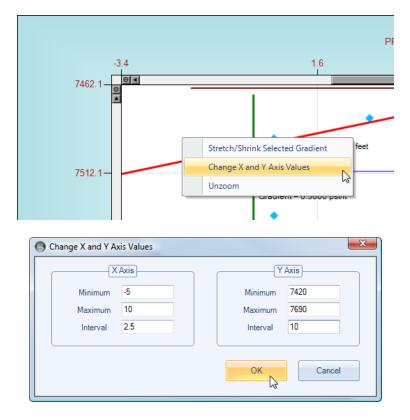

4.3 Change X and Y Axis Values

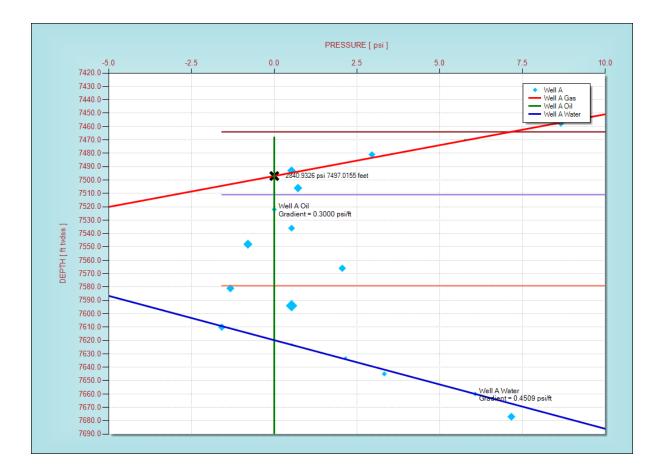

The **Change X and Y Axis Values** menu toggle item, accessed by a single right click on the main chart area, is provided primarily for presentation and report output but also provided as a global reset view

option.

Once the user selects the *Change X and Y Axis Values* menu toggle item an input box will popup with the current X and Y minimum and maximum values. To change these values to more aesthetic or rounded numbers simply type in new values and press the OK button. See pictures below.

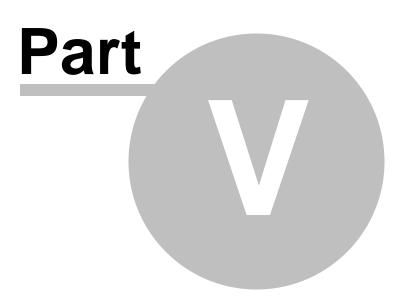

The result should like the following:

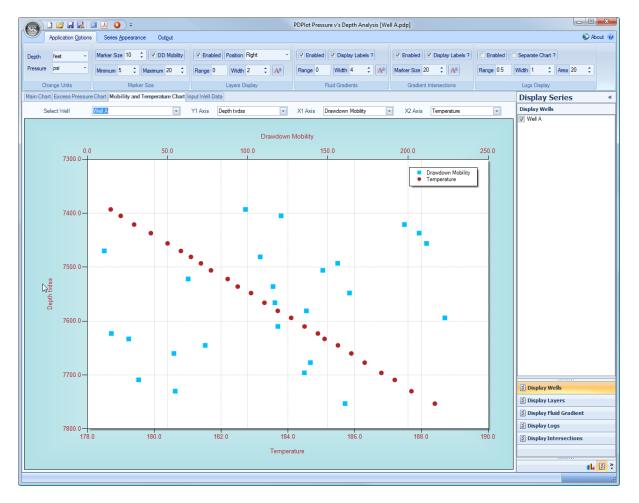

PDPlot

Pressure vs Depth Analysis

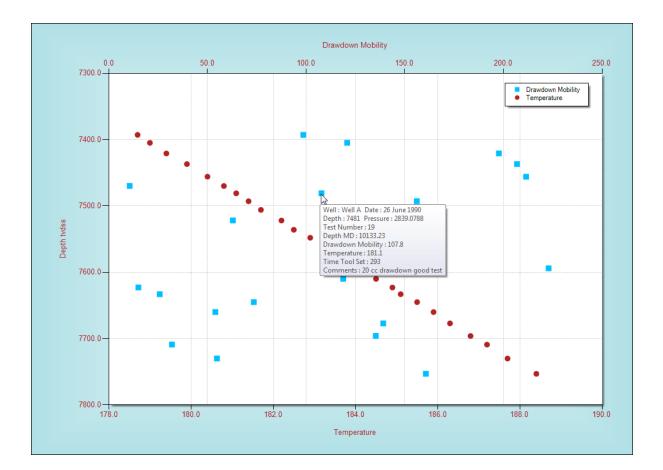

5 Mobility and Temperature Chart Operations

A third chart is provided for additional quick data quality control.

Assuming data has been entered, the user can toggle between the various dropdown boxes to display either Depth as tvd or md, and drawdown mobility and temperature.

Tooltips are also provided for this chart. See below.

PDPlot

Pressure v/s Depth Analysis

6 Chart Display Options

Within the PDPlot Application Options and Series Appearance Ribbonbar tabs, shown below, there are numerous options to change almost all aspects of the chart display. A brief description is provided below for each of these options.

The *Layer X Range Tolerance* inputbox allows the user to change to range over which individual layer depth values are displayed over the well specific pressure range.

A value of 0 results in the layer depth value being displayed exactly from the minimum to maximum pressure values entered for a specific well.

A value of 0.1 will result in the layer depth value being displayed 10% less than the minimum pressure value and 10% more than the maximum pressure value entered for a specific well.

A value of 0.25 results in Logs being displayed from the minimum pressure value, entered for a specific well, to 25% of the range (maximum - minimum) of pressure values entered for a specific well. Likewise a value of 0.5 will display the Logs across 50% of the pressure range of values entered for a specific well.

The option is also provided to toggle between the logs displayed either as a separate chart parallel to the main display chart, or integrated into the main chart area. To toggle between these display options select the *Display Logs as Separate Chart* property option highlighted below.

Pressure vs Depth Analysis

Part VIII

7 Units

7.1 Depth

Units have been kept simple. ie., Depth units consist of *feet* and *metres* and Pressure units consist of *psi* and *bar*.

Fluid gradients and PVT input have deliberately been left entirely in Oilfield imperial units; ie. "psi/ft", since it is very common industry practice to quote fluid density values in this manner. For example gas gradient of 0.08 psi/ft, oil gradient of 0.3 psi/ft and water gradient of 0.45 psi/ft.

To select between the available depth units, simply toggle between main menu items of *feet* and *metres*, as shown below. Any depth values already entered into the application will automatically be changed to the new selected unit.

Pressure v/s Depth Analysis

8 Change Chart Colors and Formats

8.1 Change Series Appearance

For individual pressure depth series, the user can either :

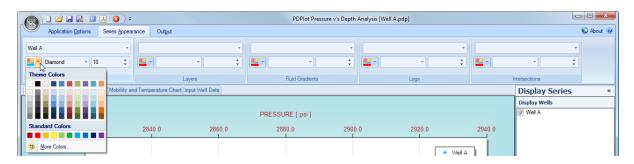

- · Choose to to have a fixed marker size, or
- Link the marker size to the value of drawdown mobility, ie., the higher the value of drawdown mobility the larger the marker size.

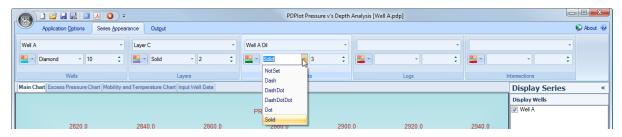

To select the latter option, select the checkbox item in the PDPlot Application Options ribbonbar tab **DD Mobility**, as shown below.

			PDPIot Pressure v's Depth Analysis [Well A.pdp]

Main	Chart Excess Pressure	Chart Mobility and Ten Link Marker Size I	o Drawdown Mobility			Display Series	*	

The minimum and maximum values of marker size can also be changed by selecting the items immediately underneath called *Mininum* and *Maximum*. See above screenshot.

Various options are also provided to allow the user to change the color and style for all of the individually displayed series, via the Series Appearance ribbonbar tab, as shown below.

8.2 Change Chart Settings

Various options are provided to allow the user to change the format and label displayed for both the X and Y Axes, the Chart Legend and overall Chart Appearance.

To change any of the chart options select the Chart Settings navigation panel (or Chart icon), in the
